An ORF has been identified within the sequence. The 5' ESTS were prepared from total human RNAs or polyA+ RNAs derived from 30 different tissues. EST sequences usually correspond enring from the 3' untranslated region (UTR) of the mRNA because they are often obtained from oligo-dT primed cDNA libraries. Such ESTS are not well suited for isolating cDNA sequences derived from the 5' ends of

mRNAs and even in those cases where longer CDNA sequences have been obtained, the full 5' UTR is rarely included. 5' ESTs are derived from mRNAs with intact 5' ends and can therefore be used to obtain full length cDNAs and genomic DNAs. 5' ESTs are also used in diagnostic, forensic, gene therapy and chronosome mapping procedures. They are used to obtain upstream regulatory sequences and to design expression and secretion
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   115

                                                          This invention describes novel human nucleic acid sequences from normal breast tissue which have cytostatic activity. The nucleic acid sequences can be used to produce and isolate full-length gene sequences. They can be used to express proteins, which can be used as tools to find an activity against breast cancer. The sequences can be used in sense or antisense form. They are especially useful for medicaments for gene therapy to treat breast cancer and for treating illnesses associated with fat metabolism. The present invention describes a method for determining whether a compound induces a toxic effect on a tissue or cell. The method comprises preparing a gene expression profile of a tissue or cell sample exposed to the compound, and comparing the gene expression profile to a database comprising data or information on the Tox mean and non-Tox mean value. The method is useful for predicting or identifying at least one toxic genes listed in the specification are useful as diagnostic or toxicity markers for the prediction or identification of the physiological state of tissue or cell sample that has been exposed to a compound, or to identify or predict the toxic effects of a compound or an agent. These may also be used as markers for monitoring toxicity progression or for drug screening. The present sequence represents a primary rat hepatocyte toxicity modelling related gene sequence from the present invention.
                                                                                                                                                                                                                        toxic effect; gene expression profile; hepatotoxicity; diagnostic marker; toxicity marker; toxicity progression; drug screening; primary rat hepatocyte toxicity modelling; gene; ds.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        Determining if a compound induces a toxic effect on a tissue or cell, for identifying hepatotoxic compounds, comprises comparing a gene expression profile of a tissue or cell sample to a database of Tox mean and non-Tox mean values.
                                                                                                                                                                       Primary rat hepatocyte toxicity modelling related gene SEQ ID NO:3184
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     Ξ

The invention relates to a novel method of predicting at least one toxic effect of a compound. The method comprises a gene expression profile of a tissue or cell sample exposed to the compound, and comparing the gene expression profile to a database comprising at least part of the data or information given in the specification. The methods are useful for predicting at least one toxic effect of a compound, predicting the progression of a toxic effect of a compound, predicting the progression of a toxic effect of a compound, predicting the renal toxicity of a compound, or identifying toxicity markers in tissues or calls exposed to known renal toxin. The genes are useful as toxicity markers in drug screening and toxicity assays, in monitoring disease or physiological states, or disease progression. This polymucheotide represents a rat DNA sequence relating to the toxic effect database comparative in the specification. NOTE: The sequence data for this patent din of form part of the printed specification, but was obtained in electronic format directly from the World Intellectual Property
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 Predicting at least one toxic effect of a compound, useful for toxicity modeling, comprises preparing a gene expression profile of a tissue or cell sample exposed to the compound, and comparing the gene expression
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       Ξ
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               Elashoff

                                                                                                                                                                                                                                                                                                                                                                                                   Rat sequence differentially expressed in response to a hepatotoxin #1419.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       Predicting toxic effects of compounds or the progression of these toxic effects by determining the changes in gene expression in tissues or cells exposed to the toxin and comparing these to gene expression in unexposed tissues or cells.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              The invention relates to methods for predicting toxic effects of compounds or the progression of these toxic effects by determining the global changes in gene expression in tissues or cells exposed to the toxin and comparing these to gene expression in unexposed tissues or cells. Also included are methods of predicting at least one toxic effect of a compound or progression of a toxic effect, preferably the

cc expression in a tissue or cell sample exposed to the compound of two or more genes listed in the specification, where differential expression of the genes is indicative of at least one toxic effect or progression. The method can also be used to identify an agent which modulates the toxic response and predict callular pathways that a compound modulates in a cell. The methods utilise a set of at least two probes (on a solid support in kit form), where each of the probes comprises a sequence that specifically hybridises to a gene listed in the specification, a computer specifically hybridises to a gene listed in the specification, a computer specifically hybridises containing information identifying the expression level in a tissue or cell sample exposed to a hepatocoxin of a set of genes comprising at least two genes listed in the specification, and a user interface to view the information used to present information clantifying the expression and for identifying toxicity markers in clisted in the specification. The method is useful for elucidating global chartes in drug screening and toxicity assays. The genes and toxicity markers in drug screening and toxicity assays. The genes and consider that has been exposed to a known toxin. The genes may be used as toxicity markers in drug screening and toxicity assays. The genes and consider that has been exposed to a compound or agent. Hepatotoxicity is characterised by centrilobular necrosis and steatosis. The present consider which is differentially expressed engance to a henatoric remember to a henatoric remember to a henatoric and sense.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            642

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  The invention relates to a method of predicting (the progression of) a toxic effect of a compound by preparing a gene expression profile of a toxic effect of a compound by preparing a gene expression profile to a database, or detecting the level of gene(s) gene expression in a tissue or cell sample exposed to the compound, where carpession in a tissue or cell sample exposed to the compound, where differential gene expression compared to a control indicates a toxic effect (toxicity progression). The method is useful for predicting (the progression of) at least one toxic effect of a compound. The genes are useful as toxicity markers in drug screening and toxicity assays. The methods are useful for predicting the likelihood that a compound or test agent will induce various specific kidney pathologies, such as nephritis, kidney necrosis, glomerular and tubular injury, or focal segmental glomerulosclerosis. The methods are useful for determining the similarity of a toxic response to one or more individual compounds and for predicting or endelling the potential cellular pathways influenced, induced or modelling the progression of renal disease states, for identifying genes that show promise as new drug targets and for screening known and newly compand drugs. This sequence corresponds to a gene marker used in the method of the invention. (Note: The sequence data for this patent did not form part of the printed specification, but was obtained in electronic form the different of the progression of the sequence data for this patent did not format directly from WIPO at ftp.wipo.int/pub/published_pot_egeneses.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 Predicting (the progression of) a toxic effect of a compound, for monitoring the progression of renal disease states, comprises preparing agene expression profile of a kidney tissue or cell sample exposed to the

The present sequence is one of a large number of 5' ESTS derived from mRNAs encoding secreted proteins. No ORF has yet been conclusively identified within the present sequence. The 5' ESTS were prepared from total human RNAs or polyA+ RNAs derived from 30 different tissues. EST sequences usually correspond mainly to the 3' untranslated region (UTR) of the mRNA because they are often obtained from oligo-dT primed cDNA libraries. Such ESTs are often obtained from oligo-dT primed cDNA derived from the 5' ends of mRNAs and even in those cases where longer CDNA sequences have been obtained, the full 5' UTR is rarely included. 5' ESTs are derived from mRNAs with intact 5' ends and can therefore be used to obtain full length cDNAs and genomic DNAs. 5' ESTs are also used in diagnostic, forensic, gene therapy and chromosome mapping procedures. They are used to obtain upstream regulatory sequences and to design
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              462
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         522
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         642
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      ArgArgTyrArgLeuProSerAsnValAspGlnSerAlaLeuSerCysSerLeuSerAla 135

The invention relates to a purilied nuclear dation designated LMFD), derived from cattle, and the LMFD nucleic acid can specifically hybridise to a second nucleic acid molecule comprising any of 15112 nuclectide sequences, appearing as ABX34836-ABX49347, or complements of them. Also included are (i) a transformed cell having a nucleic acid comprising an LMFD nucleic acid linked to a promoter and a 3' non- translated sequence that functions in the cell to cause termination of transcription and addition of polyadenylated ribonuclectides to a 'mon-translated sequence that functions in the cell to cause termination of transcription and addition of polyadenylated ribonuclectides to a 'molecule in a bovine cell or tissue comprising a level or pattern of a molecule in a bovine cell or tissue complementary nucleic acid molecule obtained from the bovine cell or tissue, where hybridisation between the marker nucleic acid and the complementary nucleic acid permits the detection of the molecule; and (b) detecting the level or pattern of the complementary nucleic acid permits the detection of the molecule. The LMFD nucleic acid is used for the detection of the complementary nucleic acid is used for the detection of the molecule. The LMFD nucleic acid is used for tissue. The large of the molecule in a bovine cell or tissue. The large of the complementary nucleic acid is used for the complementary nucleic acid is used for the complementary nucleic acid is used for the determining a level or pattern of a molecule in a bovine cell or tissue. The present sequence is one of the complement and sequence and not shown in the specification but was obtained in particular in the specification but was obtained in
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        invention relates to a purified nucleic acid molecule associated with
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  and muscle and fat identification and analysis,
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              13
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   89
                Bovine, 88; EST; expressed sequence tag; lactation; LMFD; muscle deposition; fat deposition; genome mapping; gene identification; gene analysis; cattle breeding.

appearing as ABX34836-ABX49947, or complements of them. Also included are

i (1) a transformed cell having a nucleic acid comprising an LWFD nucleic
acid linked to a promoter and a 3' non-translated sequence that
the cell to cause termination of transcription and addition
of polyadenylated ribonucleotides to a 3' end of the mRNA molecule; and
(2) determining a level or pattern of a molecule in a bovine cell or
tissue comprising: (a) incubating a marker nucleic acid (comprising any
of the 15112 nucleic acid sequences or its complement or fragment) with a
complementary nucleic acid permits the detection of the molecule; and (b)
tissue, where hybridisation between the marker nucleic acid and the
complementary nucleic acid permits the detection of the molecule; and (b)
detecting the level or pattern of the complementary nucleic acid, where
the detection of the complementary nucleic acid is used for
detecting the level or pattern of a molecule in a bovine cell or tissue.

It is useful for genome mapping, gene identification and analysis, cattle
breeding, preparation of constructs for use in cattle gene expression, or
for genetically improving cattle. The present sequence is one of the
correspondence was not shown in the specification but was obtained in
electronic format from the USPTO web site:

The invention relates to a nucleic acid probe for measuring human gene sequences in the specification, or their complements or fragments, and esquences in the specification. The probe is a single exon probe that conditions at least 8 amino acids of any of the 6808 amino acids and encoding at least 8 amino acids of any of the 6808 amino acid sequences ("Illy defined in the specification. The probe is a single exon probe that thybridises under high stringency conditions to a nucleic acid molecule expression (comprising a plurality of single exon nucleic acid molecule. The probes of single exon nucleic acid probes for measuring human gene expression, a method of probes cited above, where each of the plurality of probes is separately and addressably isolately buman gene expression, a method of probe cited above, an ORF-encoded peptide comprising at least 8 contiguous amino acids of any of the above-mentioned amino acids or probe cited above, an ORF-encoded peptide comprising at least 8 contiguous amino acids of any of the above-mentioned amino acids or probe cited above, an ORF-encoded peptide comprising at least 8 contiguous amino acids of any of the above-mentioned amino acids or probe cited above, and of the above-mentioned amino acids or probe cited antibody that binds specifically to a peptide cited above, methods of selling and/or licensing single exon probes or microarrays to contiguous amino acids and subscription, and a computer-readable methods of selling and/or licensing single exon probes or microarrays to human gene expression data by subscription, and a computer-readable correct encoding and acida above. The probes may be used as tools for surveying the probes or the probes may be used as tools for surveying tissues to detect the probes may be used as tools for surveying tissues to detect the probes may be used as tools for surveying analize abone. The probes may be used as tools for surveying analize abone, or in constructing genome-called probe of the invention. Note: The sequence data for this spec
                                                                                                                                                                                                                                                                                                                                                                                                                                                                New human genome-derived single exon nucleic acid probes useful for human gene expression analysis, for identifying or characterizing alternative splicing events, for assessing genomic alterations or as tools for
  Human; probe; 88; gene expression; single exon probe; microarray; alternative splicing event; genomic alteration.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  Claim 1; SEQ ID NO 26581; 80pp; English.

The probe is a single exon probe that hypridises under high stringency conditions to a nucleic acid molecule expressed in human cells or tissues. Also included are a spatially-addressable set of single exon nucleic acid probes for measuring human

methods of selling and/or licensing single exon probes or microarrays to a customer desiring to measure gene expression, a method of providing human gene expression, and a computer-readable storage medium which contains a database having a plurality of records (each record including data on the expression of a single exon probe cited above. The probe methods and apparatus are useful in gene expression analysis. The probes may be used as tools for surveying tissues to detect the presence of expressed messages that contain their specific exon, or in constructing genome-derived single exon microarrays. In addition, the probes are used in identifying and characterising gross alternative splicing events, in detecting and characterising gross alternations in the genomic locus that includes their exon, in assessing smaller genomic alterations, in priming the synthesis of nucleic acids, or in expressing the ORF-encoded peptide. The present sequence is a human single exon probe of the invention. Note: The sequence data for this patent did not form part of the printed specification, but was obtained in electronic format directly from USPTO at

The invention relates to an isolated polypeptide (I) associated with breast cancer which is encoded by a nucleic acid molecule comprising a nucleotide sequence (SI). Further disclosed is an antibody that binds to the polypeptide of the invention. The activity of the polypeptide of the invention may be described as cytostatic. The antibody is useful for detecting the presence of (I) in a sample. Nucleic acid molecules of the invention are useful in the detection of breast tumours. (I) is useful as a marker for breast cancer and in breast cancer therapy. Sequences given in records ACN78851-ACN92934 represent nucleic acid markers associated with breast cancer. Note: The sequence listing does not form part of the specification but may be obtained in electronic format from the USPTO web
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           155

                                                                                                                                                                                                                                                                                                                                                                                                              The invention relates to an isolated polynucleotide comprising any one of 38043 cDNA sequences, appearing as ACH12789-ACH50831, whose sequence was determined by the technique of SBH (sequencing by hybridisation). Also included is a purified polypeptide comprising a sequence corresponding to a reading frame of the novel polynucleotide. The nucleic acid sequences are useful in diagnostics as expressed sequence tags (BST) for identifying expressed genes or for physical mapping of the human genome, in forensics, in assessing biodiversities, or in identifying mutations responsible for genetic disorders and other traits. The nucleotide sequences are also useful as hybridisation probbes, as oligomers for PCR, or chromosome and gene mapping, in the recombinant production of protein, or in generating antisease DNA or RNA. The purified polypeptide is useful for generating antisease DNA or RNA. The purified polypeptide is useful for generating antisease process. Sequences we sequence data for this patent did not form part of the printed specification, but was obtained in electronic format directly from USPTO at
                                                                                                                                                                                                                                                                                                                New polynucleotide sequences obtained from various cDNA libraries, useful as hybridization probes, as oligomers for PCR, for chromosome and gene mapping, in the recombinant production of protein, or in generating

```

The invention relates to a nucleic acid probe for measuring human gene expression, comprising any of the 27,400 fully defined nucleotide expression, comprising any of the 27,400 fully defined nucleotide acid each condition to a foreign at least 8 amino acid so any of the 6888 amino acid sequences fully defined in the specification. The probe is a single exon probe that compressed in human cells or tissues. Also included are a spatially-expressed in human cells or tissues. Also included are a spatially-addressable set of single exon nucleic acid probes for measuring human cells or tissues. Also included are a spatially-compact of comprising a plurality of single exon nucleic acid probes is separately and addressably isolatable or amplifiable from the plurality), a single compact of measuring human gene expression, a vector comprising at least 8 contiguous amino acids of any of the above-mentioned amino acid and contiguous amino acids of any of the above-mentioned amino acid and sequences (optionally with conservative amino acids amino acid substitutions), and solated antibody that binds specifically to a peptide cited above, and/or licensing single exon probes or microarrays to meathods of selling and/or licensing single exon probes or microarrays compact acus and acustomer destring to measure gene expression, a method of providing to human gene expression date by subscription, and a computer-readable contains a database having a plurality of records New human genome-derived single exon nucleic acid probes useful for human gene expression analysis, for identifying or characterizing alternative splicing events, for assessing genomic alterations or as tools for Claim 15; SEQ ID NO 1061; 80pp; English. WPI; 2004-119264/12. surveying tissues.

(each record including data on the expression of a single exon probe cited above. The probe, methods and apparatus are useful in gene expression analysis. The probes may be used as tools for surveying tissues to detect the probes may be used as tools for surveying tissues to detect the presence of expressed messages that contain their specific exon, or in constructing genome-derived single exon microarrays. In addition, the probes are used in identifying and characterising alternative splicing events, in detecting and characterising alternations in the genomic locus that includes their exon, in assessing smaller genomic alterations, in priming the synthesis of nucleic acids, or in expressing the ORF-encoded peptide. The present sequence is a human single exon probe of the invention. Note: The sequence data for this patent did not form art of the printed specification, but was obtained in electronic format directly from USPTO at
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  266 TCGTCCACCATCAGCCCCTACTACCGCCAGCTCCTTCCGCACCGTGCTGGACTCCGGC 325

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               mesenteric ischaemia, anal fissure, achalasia, impotence, migraine, or ischaemic muscle injury associated with smooth muscle spasm. The polypeptides and HSP 20 are also useful for inhibiting smooth muscle cell proliferation and/or migration. The present sequence represents a peptide used in a polypeptide of the invention.
                                                                                                                                                                                                                                                                The invention relates to a novel polypeptide comprising a heat shock protein 20-derived polypeptide. A polypeptide of the invention has cytostatic, antiarteriosclerotic, vasotropic, antianginal cerebroprotective, antiarrhyhmic, vasotropic, antianginal, hypotensive, antiarrhyhmic, antiasthmatic, gynaecological, hypotensive, antimigraine, tocolytic, and relaxant activity, and may act as a HSP agonist or antagonist. The polypeptides, heat shock protein (HSP) 20, and methods are useful for treating or preventing a disorder, e.g. intimal hyperplasia, stenosis, restenosis, transplant vasculopathy, anthroroclerosis, smooth muscle cell tumours such as leiomyosarcoma, or vasospasm, which is associated with angina, coronary vasospasm, prinzmetal's angina, coronary ischaemia, stroke, bradycardia, prinzmetal's angina, coronary ischaemia, stroke, bradycardia, toxemia of pregnancy, pre-term labour, pre-eclampsia, Raynaud's disease, Raynaud's phenomenon, haemolytic-uremia, non-occlusive
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      73 cccessasscratrisarcaacscritisscsassesriacresasscraarrascassa 132

The activity of polynucleotides of the invention may be described as, valuerary, neuroprotective, immunomodulator, cytostatic and anti-inflammatory. Compositions comprising nucleic acids of the invention are useful for treating a mammalian subject, or as nutritional sources or supplements. These are useful in gene therapy, particularly for treating wounds, burns or ulcers, Alzheimer, disease, Huntington's disease, amyotrophic lateral sclerosis, autoimmune disorders, cancer or inflammation. The nucleic acids and polypeptides are also useful in diagnostic and research methods. The sequences given in records ABQ60788-ABQ61231 represent polynucleotides of the invention. NOTE: The sequence data for this patent did not form part of the printed specification, but was obtained in electronic format directly from WIPO at

Isolated nucleic acid molecule encoding a channel/transporter protein is used in preventing, treating or ameliorating a medical condition.

Claim 1; SEQ ID NO 37; 809pp; English.

ø The invention relates to an isolated nucleic acid molecule encoding a channel/transporter protein or sequences at least 95% identical to a these. The nucleic acids and proteins encoded by them are used to treatment; EST; expressed sequence tag; cytostatic;

cancer; gene therapy; ss

DE19818620-A1 Homo sapiens.

rabbits, preset, horses, cats, dogs, chickens or sheep. They are also used in diagnosing a pathological condition or susceptibility to a pathological condition or susceptibility to a pathological condition. The antibodies to the proteins can also be used in alleviating symptoms associated with the disorders and in diagnostic immunoassays e.g. radioimmunoassays or enzyme linked immunosorbent assays (ELISA) Disorders which are diagnosed or treated include autoimmune diseases e.g. rheumatoid arthitis, hyperproliferative disorders e.g. neoplasms of the breast or liver, cardiovascular disorders e.g. cardiac arrest, cerebrovascular disorders e.g. cerebral ischemia, anglogenesis, nervous system disorders e.g. Alzabiner's disease, infections caused by bacteria, viruses and fungi and ocular disorders e.g. corneal infection. The polypeptides can also be used to aid wound healing and epithelial cell proliferation, to prevent skin aging due to sumburn, to maintain organs before transplantation, for supporting cell culture of primary tissues, to regenerate tissues and in chemotaxis. The polypeptides can also be used and in themcatis the polypeptides can also be used to a gione of primary tissues, to regenerate tissues and in chemotaxis. The polypeptides can also be used as a food additive or preservative to increase or decrease storage capabilities. This sequence corresponds to a gene of the
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  163 CTCTGCCCCACCACGCTCGCCCCCTACTAC-----CTGCGCGCACCCAGCGTGGCG 213

This invention describes novel polypeptide fragment sequences (I) and their encoding nucleic acids (II) which are highly expressed in normal bladder tissue and have cytostatic activity. (II) are used for recombinant expression of (I) and to isolate complete genes. (I) are used to identify agents suitable for the treatment of bladder tumours, to directly treat this form of cancer (including expression from gene therapy vectors), or are used in a preparation for cancer treatment. (I) is also used for the generation of specific antibodies. (II) are chently assembling ESTS (expressed sequence tags) from a particular tissue type before comparison of expression patterns. This allows a significantly longer fragment of the gene to be revealed, and therefore reduces the number of failures because of ESTS from different libraries centences the number of expression patterns. This allows a seminated frequency of cocurrence in a particular tissue. AAZ41122-Z42248 estimated frequency of cocurrence in a particular tissue. AAZ41122-Z42248
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  89 cccegaceccrcrrrgaccaecerrcescaaesecrecrecaecesaecrescaecres 148
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   149 CTCTGCCCCACCACGCCCCCCTACTAC -----CTGCGCGCACCCAGGGTGGCG 199

Disorders which are diagnosed or treated include autoimmunosorbent diseases e.g. radioimmunosseays or treated include autoimmune diseases e.g. rhumatoid arthritis, hyperproliferative disorders e.g. neoplasms of the breast or liver, cardiovascular disorders e.g. cardior arrest, cerebrovascular disorders e.g. cardior arrest, cerebrovascular disorders e.g. cardior arrest, system disorders e.g. Alzheimer's disease, infections caused by bacteria, viruses and fungi and ocular disorders e.g. corneal infection. The polypeptides can also be used to aid wound healing and epithelial organs before transplantation, for supporting cell culture of primary tissues, to regenerate tissues and in chemotaxis. The polypeptides can also be used as a food additive or preservative to increase or decrease
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        channel/transporter protein or sequences at least 95% identical to a these. The nucleic acids and proteins encoded by them are used to prevent, treat or ameliorate a medical condition in e.g. humans, mice, rabbits, goats, horses, cats, dogs, chickens or sheep. They are also used in diagnosing a pathological condition or susceptibility to a pathological condition or susceptibility to a pathological symptoms associated with the disorders and in diagnostic

which represent the human ORFX open reading frames 1 to 3161. The ORFX sequences have activities such as: cytostatic; hepatotropic; vulnerary; antiporiatic; antiparkinsonian; mootropic; neuroprotective; osteopathic; anticonvulsant; antiarthritic; immunosuppressant; immunostimulant; cardiant; thrombolytic; coagulant; vasotropic; antidiabetic; hypotensive; dermatological; immunosuppressant; antidiabetic; hypotensive; antivortaria; antitheumatic; antithyroid; and antianaemic. The antiviral; antitheumatic; antithyroid; and antianaemic. The sequences can be used for determining the presence of or predisposition (DC) or preventing or treating pathological conditions associated with an ORFX-associated disorder. The nucleic acids can be used to express ORFX proteins in gene therapy vectors. The proteins and nucleic acids may be used to treat cancers, proliferative disorders, neurodegenerative used to treat cancers, proliferative disorders, cardiovascular disease, disorders, osteoarthritis, graft vs host disease, cardiovascular disease, storage, systemic lupus erythematosus, severe combined immunodeficiency (SCID), AIDS, viral, bacterial and premamental, antising manatory disease; to anticing deamage, nocturnal haemoglobinuria, antisinflammatory disease; to anticing deamage, nocturnal haemoglobinuria, antisinflammatory disease; to
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             GIGCUGIGCAGCCGTCTTGGCTGCGCCCTCGGCCCCGTTGCCCGGACTTTCGGCG 372

The method of the invention has cytostatic applications and may be useful for detecting soft tissue sarcoma, possibly via gene therapy or vaccine production. The nucleic acid sequences may be useful in diagnostic and screening applications. The current sequence is that of a human soft tissue sarcoma-upregulated DNA of the invention. The current sequence is not shown within the
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                soft tissue sarcoma; cytostatic; gene therapy; vaccine; screening; human;

The invention relates to a nucleic acid probe for measuring human gene expression, comprising any of the 27,400 fully defined nucleotide expression, comprising any of the 27,400 fully defined nucleotide expression, acid sequences in the specification, or their complements or fragments and encoding at least 8 amino acid so any of the 6888 amino acid sequences fully defined in the specification. The probe is a single exon probe that hybridises under high stringency conditions to a nucleic acid molecule expression (comprising a plurality of single exon nucleic acid molecule captressed in human cells or tissues. Also included are a spatially-compressed in human cells or amplifiable from the plurality), a single exon gene expression (comprising to a molecular or and addressably isolatable or amplifiable from the plurality), a single exon microarray for measuring human gene expression, a vector comprising the single exon probe cited above, an ORF-encoded peptide comprising the single exon probe cited above, an ORF-encoded peptide comprising at least 8 contiguous amino acids of any of the above-mentioned amino acid or solated antibody that binds specifically to a peptide cited above, methods of selling and/or licensing single exon probes or microarrays to contiguous mino acids of measure gene expression, a method of providing channed expression data by subscription, and a computer-readable content expression analysis. The probes may be used as tools for surveying capters in deadition, the probes are used apparatus are useful in gene expression analysis. The probes may be used as tools for surveying captering applicing events, in detecting and characterising and characterising all exon in constructing genome-derived single exon microarrays. In addition, the probes are used in identifying and characterising in all expression and in constructing enderived single exon microarrays.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               smaller genomic alterations, in priming the synthesis of nucleic acids, or in expressing the ORF-encoded peptide. The present sequence is a human single exon probe of the invention. Note: The sequence data for this
                                                                                                                                                                                                                                                                                                                                                                                       New human genome-derived single exon nucleic acid probes useful for hums gene expression analysis, for identifying or characterizing alternative splicing events, for assessing genomic alterations or as tools for
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  alterations in the genomic locus that includes their exon, in assessing

                                                                                                                                                                                                                                                                                                                                                                                                                                                            8
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           The invention relates to an isolated polynucleotide comprising any one of 38043 CDNA sequences, appearing as ACH12789-ACH50831, whose sequence was determined by the technique of SBH (sequencing by hybridisation). Also included is a purified polypetide comprising a sequence corresponding to a reading frame of the novel polynucleotide. The nucleic acid sequences care useful in diagnostics as expressed sequence tags (EST) for identifying expressed genes or for physical mapping of the human genome, in forensics, in assessing biodiversities, or in identifying mutations responsible for genetic disorders and other traits. The nucleotide sequences are also useful as hybridisation probes, as oligomers for PCR, correction of protein, or in generating antisense DNA or RNA. The purified polypeptide is useful for generating antisease DNA or RNA. The purified polypeptide is useful for generating antisease DNA or RNA. The purified polypeptide is useful for generating antisease of sequences. Note: The present sequence for this patent did not form part of the printed specification, but was obtained in electronic format directly from USPTO at
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              New polynucleotide sequences obtained from various cDNA libraries, useful as hybridization probes, as oligomers for PCR, for chromosome and gene mapping, in the recombinant production of protein, or in generating antisense DNA or RNA.

cerebroprotective, antiarrhythmic, amountupt, antianismus, cerebroprotective, antiarrhythmic, antiarrhythmic, antiarrhythmic, and relaxant activity, and may act as a HSP agonist or antagonist. The polypeptides, heat shock protein (HSP) 20, and methods are useful for treating or preventing a disorder, e.g. intimal hyperplasia, stenosis, restenosis, transplant vasculopathy, atherosclerosis, smooth muscle cell tumours such as leionyosarcoma, or vasosopasm, which is associated with angina, coronary vasospasm, prinzmetal's angina, coronary ischaemia, stroke, bradycardia, prinzmetal's angina, coronary ischaemia, stroke, bradycardia, toxemia of pregnancy, pre-term labour, pre-eclampsia/eclampsia, Raynaud's disease, Raynaud's phenomenon, haemolytic-uremia, non-occlusive
                                                                                                                                                                                                                                                                                                                                                                               proliferation and/or migration. The present sequence represents a peptide used in a polypeptide of the invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 244 CATTTTAGTCCAGAAGAAATTTCAGTAAAAGTAGTGGGAGCACATGTCGAGGTACATGCT 303
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               99 LysHisAsnGluArgGlnAspAspHisGlyTyrIleSerArgGluPheHisArgArgTyr 118
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 ArgleuProSerAsnValAspGlnSerAlaLeuSerCysSerLeuSerAlaAspGlyMet 138

```
The invention relates to a novel method of predicting at least one toxic effect of a compound. The method comprises a gene expression profile of a cissue or cell sample exposed to the compound, and comparing the gene expression profile to a database computed, and comparing the gene captession profile to a database comprising at least part of the data or information given in the specification. The methods are useful for predicting at least one toxic effect of a compound, predicting the renal coxicity of a compound, or identifying toxicity markers in tissues or toxicity of a compound, or identifying toxicity markers in tissues or cells exposed to known renal toxin. The genes are useful as toxicity markers in drugs screening and toxicity assays, in monitoring disease or physiological states, or disease progression. This polynucleotide captesents a rat DNA sequence relating to the toxic effect database discribed in the specification. NOTE: The sequence data for this patent clid not form part of the printed specification, but was obtained in electionic format directly from the world intellectual Property
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                Predicting at least one toxic effect of a compound useful for toxicity modeling, comprises preparing a gene expression profile of a tissue or mell sample exposed to the compound, and comparing the gene expression profile to a database.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      Elashoff M;

The invention relates to a purified nucleic acid molecule associated with cattation or muscle and fat deposition (designated LMFD), derived from cattle, and the LMFD nucleic acid can apecifically hybridise to a second mucleic acid molecule comprising an uppecifically hybridise to a second and it aransformed cell having a nucleic acid comprising an LMFD nucleic acid linked to a promoter and a 3 non- translated sequence that functions in the cell to cause termination of transcription and addition of polyadenylated ribonucleotides to a 3 end of the mRNA molecule; and (2) determining a level or pattern of a molecule in a bovine cell or tissue comprising: (a) incubating a marker nucleic acid (comprising any of the subsequences or its complementary nucleic acid molecule obtained from the bovine cell or tissue, where hybridisation between the marker nucleic acid and the complementary nucleic acid permits the detection of the molecule; and (b) detecting the level or pattern of the complementary nucleic acid permits the detection of the molecule. The LMPD nucleic acid, where the detection of the molecule. The LMPD nucleic acid is predictive of the complementary nucleic acid is predictive of the determining a level or pattern of a molecule in a bovine cell or tissue. It is useful for genome mapping, gern identification and analysis, cattle for genetically improving cattle. The present sequence is one of the complement sequence was not shown in the present sequence in the present sequence was not shown in the specification but was obtained in a complement or the molecule.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                112
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           131
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       191
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              132
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   251
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      92

An ORF has been identified within the sequence. The S' ESTs were prepared from total human RNAs or polyA+ RNAs derived from 30 different tissues. ESTs sequences usually correspond mainly to the 3' untranslated region (UTR) of the mRNA because they are often obtained from oligo-dT primmed cDNA libraries. Such ESTs are not well suited for isolating cDNA sequences derived from the 5' ends of mRNAs and even in those cases where longer cDNA sequences have been obtained, the full 5' UTR is rarely included. 5' ESTs are derived from mRNAs with intact 5' ends and can therefore be used to obtain full length cDNAs and genomic DNAs. 5' ESTs are also used in diagnostic, forensic, gene therapy and chromosome mapping procedures. They are used to obtain
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           83

The invention relates to an isolated polynucleotide comprising any one of 38043 cDNA sequences, appearing as ACH12789-ACH5081, whose sequence was determined by the technique of SBH (sequencing by hybridisation). Also determined by the technique of SBH (sequencing by hybridisation). Also included is a purified polypeptide comprising a sequence corresponding to a reading frame of the novel polynucleotide. The nucleic acid sequences are useful in diagnostics as expressed sequence tags (BST) for dentifying expressed genes or for physical mapping of the human genome, in forensics, in assessing biodiversities, or in identifying mutations responsible for genetic disorders and other traits. The nucleotide sequences are also useful as hybridisation probes, as oligomers for PCR, for chromsome and gene mapping, in the recombinant production of protein, or in generating antisense DNA or RNA. The purified polypeptide is useful for generating antishodies specific for it. The present sequence is one of the 38043 isolated cDNA/RST sequences. Note: The sequence data correspondent did not form part of the printed specification, but was obtained in electronic format directly from USPTO at sequence. html?DocID=20030073623

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   66
                                                                                                      The invention relates to an isolated nucleic acid detection reagent capable of detecting 1000 or more genes from Drosophila. The invention useful in developmental biology and in elucidating cell signalling and call-cell interactions in higher eukaryotes for the development of insecticides, therapeutics and pharmaceutical drugs. The invention discloses genomic DNA sequences (ABL16176-ABL30511), expressed DNA sequences (ABL061840-ABL16175) and the encoded proteins (ABBS7737-ABB72072). The sequence data for this patent did not form part of the printed specification, but was obtained in electronic format directly from WIPO at ftp.wipo.int/pub/published_pct_sequences

No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    Sequence 5220,

Patent No. 6783961

GENERAL INFORMATION:
APPLICANT: Dumas Milne Edwards, J.B.
APPLICANT: Duclert, A.
APPLICANT: Dicramo, J.Y.
TITLE OF INVENTION: Expressed Sequence Tags and Encoded Human Proteins.
Patent No. 6783961
FILE REFERENCE: 59.US2.REG
CURRENT APPLICATION NUMBER: US/09/513,999C
CURRENT FILING DATE: 2000-02-24
FRIOR FILING DATE: 1999-02-26
FRIOR FILING DATE: 1999-02-26
                                                                                                                                                                                                                                                                                                                                  156 GluArgAlaileProValSerArgGluGluLyBPro----ThrSerAlaPro 171

Patent No. 6783961

GENERAL INFORMATION:

APPLICANT: Dunas Milne Edwards, J.B.

APPLICANT: Duclert, A.

APPLICANT: Giordano, J.Y.

TITLE OF INVENTION: Expressed Sequence Tags and Encoded Human Proteins.

Patent No. 6783961

FILE REFERENCE: 59. US2.REC

CURRENT APPLICATION NUMBER: US/09/513,999C

CURRENT APPLICATION NUMBER: US 60/122,487

PRIOR PILING DATE: 1999-02-26

NUMBER OF SEQ ID NOS: 36691
